Full Stack Development Assessment

Create a small and simple page using React. That will display a list of properties (hotel rooms).

Requirements

The page should implement the following requirements:

- Load the properties from the specified JSON file and render them in the page.
- It is expected that at least the name and description of each property are visible.
- Filtering:
  - The page should have a text input to allow users to filter the properties.
  - When the text is entered in the field, the displayed properties should be filtered by name or description.
  - If no properties are displayed, due to filtering, then display a corresponding error message.

Tooling

You can use any tool and library to develop the web page. If you want to get going quickly, create-react-app or any other tool or React framework will help you get going quickly.

Delivery

Once finished, you can share the source code by e-mail in a zipped archived, or you can also share it in the version control service of your preference such as GitHub, Bitbucket, or any other.
